

THE BUILT CITY IS THE COOL GROUND
Hot-season surface temperature in metro Kano

Each point averages every 30 m cell with that many built-up, bare or green 10 m cells out of nine.
Built-up cells cool the ground. Farmland and bare earth heat it. Trees and grass barely move it.
Ground, not air: median of 40 clear Landsat scenes, March to May, 2015 to 2026.
